Nigeria 2025 Licensing Round

PPL 801

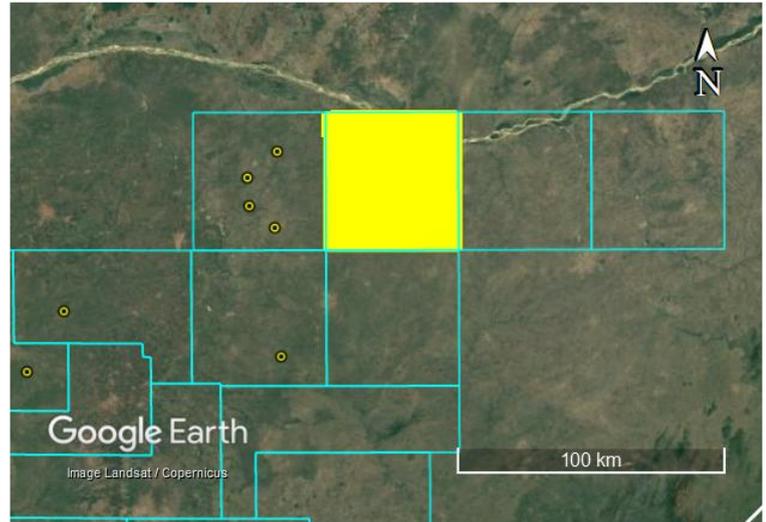

**NIGERIAN UPSTREAM
PETROLEUM REGULATORY
COMMISSION**

PPL 801 is situated within the Southern Benue Trough, a Cretaceous rift-sag basin in southeastern Nigeria. The blocks lie within the structural domain influenced by Santonian compression, which generated numerous folds, faults, and sub-basin depressions.

PPL 801 block is located on the southwestern part of the basin. The block occupies relatively frontier inland areas in the Southern Benue Trough. The most recent seismic data coverage across the block is of early 80s vintage but unavailable. No well drilled on the block.

The primary source rocks underlying these blocks are the Eze-Aku/Enugu Shales and the Nkporo Shale, both of which are organic-rich and capable of generating gas and minor oil. The blocks are associated with a combination of structural and stratigraphic traps. The Santonian compressional phase created numerous anticlines, faulted closures, and tilted blocks that can host hydrocarbons. Additionally, sand pinch-outs, channel margins, and facies transitions in the Eze-Aku and Nkporo successions offer stratigraphic trapping opportunities.
